Inverse Functions Inverse Functions If f is a one-to-one function with domain A and range B , we can define an inverse
function f^{-1} (with domain B) by the rule $f^{-1}(y) = x$ if and only if $f(x) = y$: This is a sound definition of a function,
precisely because each value of y in the domain of f^{-1} has exactly one x in A associated to it by the rule $y = f(x)$. 4th,

Is called the domain of R and the set $\text{Range}(R) = \{b \in B \mid \exists a \in A, aRb\}$ is called the range of R . Note that $\text{dom}(R) \subseteq A$ and
 $\text{Range}(R) \subseteq B$. When $A = B$, we often say that R is a (binary) relation over A . The term correspondence between A and B is also
used instead of the term relation between A and B and the 1th, 2024

we would write this using function notation as $f(x) = mx + b$, read "f of x," denoting the value of the function at
 x . We can also use other 1th, 2024
