Chapter 7. Laplace Transforms. Definition Of The Laplace ...The Important Property Of The Laplace Transform Is Its Linearity. That Is, The Laplace Transform L Is A Linear Operator. Theorem 1. (linearity Of The Transform) Let f_1 And f_2 Be Functions Whose Laplace Transform Exist For $s > \alpha$ And C_1 And C_2 Be Constants. Then, For $s > \alpha$, $L\{c_1 f_1 + c_2 f_2\} = c_1 L\{f_1\} + c_2 L\{f_2\}$. 2024Unit 1 Unit 2 Unit 3 Unit 4 Unit 5 Unit 6 Unit 7 Unit 81-1-1 Doubling Rule 3 Sounds Of Suffix -ed Prefixes: Dis-, Con-, Un-, In-, Im-Prefixes: Re-, Pre-, Pro-Suffixes And Prefixes REVIEW Closed Syllable Exceptions: Old, Ost, Olt, Ild, Ind Split Vowels Gladly Clearly Careful Armful Payment Helpless Illness Countless Fondness Treatment Wishes Slower Fastest Flexible Drinkable Jumping Longest Painter ... 2th, 20247.3 Laplace Transforms: Translations & Unit Step FunctionsEd Bueler, Dept. 6.3 Inverse Laplace Transforms Example 6.24 illustrates that inverse Laplace transforms are not unique. However, it can be shown that, if several functions have the same Laplace transform, then at most one of them is continuous. This prompts us to make the following definition.

Definition 6.25. The inverse Laplace transform $\mathcal{L}^{-1}\{F(s)\} = f(t)$, $t \geq 0$, is the unique continuous function $f(t)$ such that $F(s) = \mathcal{L}\{f(t)\}$.

Laplace transforms are useful in solving initial value problems in differential equations and can be used to relate the input to the output of a linear system. Both transforms provide an introduction to a more general theory of transforms, which are used in the study of piecewise continuous functions.

The Laplace transform $\mathcal{L}\{f(t)\} = F(s) = \int_0^{\infty} f(t)e^{-st} dt$ exists for all $s > a$.

Example 31.2. Step functions. Let c be a positive number and let $u_c(t)$ be the piecewise continuous function defined by $u_c(t) = 0$ if $t < c$ and $u_c(t) = 1$ if $t \geq c$.
